About us

With over fifty years of experience in the automotive sector, Motorquality has been able to develop, with dedication and expertise, new high-performance friction materials: **MQ450** and **MQ460**. These innovative materials, the result of years of research and improvement, are composed of blends of advanced fibres and carefully selected raw materials, including carbon and ceramic components, known for their excellent resistance to heat and pressure. Each material has been designed and produced using cutting-edge technologies, reflecting Motorquality's constant commitment to providing solutions that are up to the most difficult challenges.

The aim is to optimally respond to the ever-increasing needs of professional drivers and motorsport enthusiasts, who require superior performance, durability and reliability, even in extreme conditions. The experience accumulated over the years has led to the creation of a new range of high-performance brake pads, specifically designed to offer maximum control and safety on the track. These products are ideal for those who want to excel in competitions, rallies and trackdays, where braking precision can make the difference between victory and defeat. Motorquality, thanks to its long history and deep knowledge of the sector, confirms itself as a point of reference for those seeking cutting-edge technological solutions and superior performance in the world of competition.
Each compound is designed to ensure constant and precise braking, minimizing wear on the brake discs. We have created two compounds to meet the specific needs of each vehicle and the different racing conditions, ensuring optimal performance in any competitive environment.
Our brake pads, an expression of the excellence of **Made in Italy**, offer high performance both cold and hot, always ensuring maximum control and safety in the race.

Friction Material

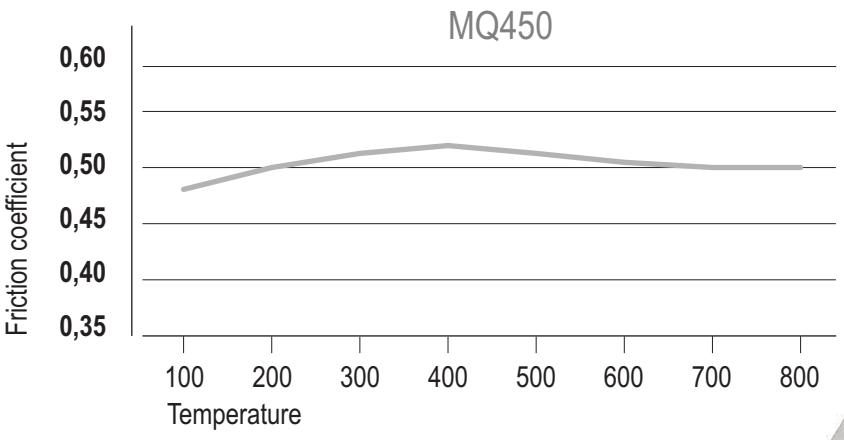

MQ450

This compound has been designed to ensure excellent performance in different driving conditions. With an average friction coefficient of 0.50, it offers excellent stability during braking, ensuring the right balance between efficiency and safety.
In addition, the initial bite is particularly reactive, ensuring an immediate response from the very first moments.

Even in low temperature conditions, the compound maintains good performance, allowing optimal operation from the first use.
Another important feature is the excellent modulability, which allows precise and gradual control of braking, essential for drivers who want a smooth and safe ride.
This compound has been developed specifically for those who participate in track days, gravel rallies or drive high-performance historic cars.

MADE IN ITALY

- ***Average friction coefficient 0.50***
- ***Excellent initial bite***
- ***Good performance at low temperature.***
- ***Excellent pedal feeling***
- ***Developed for Track day, gravel rally and historic cars.***

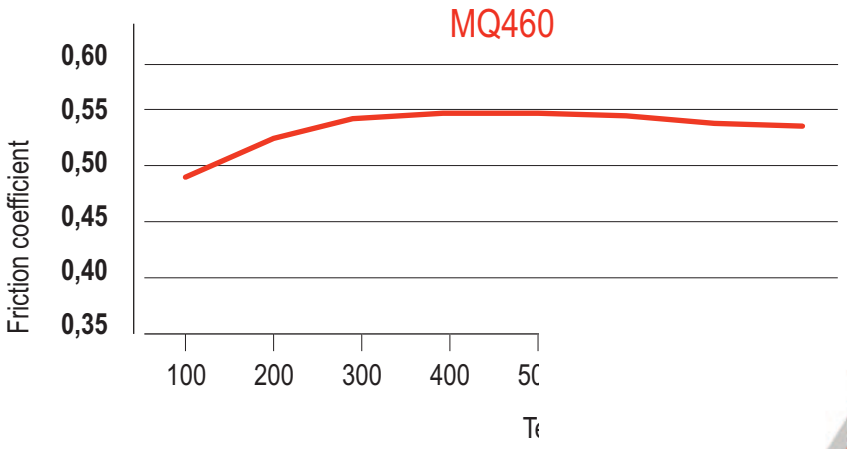

Friction Material

MQ460

This compound has been created to offer superior performance even in the most extreme conditions. With an average friction coefficient of 0.54, it guarantees powerful and reliable braking. The initial bite is excellent, ensuring immediate response to the pedal and a feeling of total control from the very first moment. A particularly important aspect is its exceptional resistance to high temperatures, maintaining stable performance even under severe thermal stress.
Furthermore, the particular material the pad is made of isolates the brake fluid and the pads themselves from high operating temperatures, helping to reduce the risk of vapor lock.
This compound has been specifically developed for the most demanding applications, such as asphalt rallying and track use, where consistent and reliable performance is required even in the most difficult situations.

MADE IN ITALY

- ***Average friction coefficient 0.54***
- ***Excellent initial bite***
- ***Excellent resistance to high temperatures***
- ***Low operating temperature of fluid and pads***
- ***Developed for the most severe applications, Rally asphalt and track.***

Bedding

Bedding procedure and usage advice To achieve maximum performance from your braking system, it is essential to carefully follow these instructions:

Checking the pistons and brake caliper

Before installing the brake pads, make sure that the pistons, seals, and the overall condition of the brake caliper are in good shape.

Checking the brake discs

Carefully inspect the brake discs to ensure they do not have cracks or scratches on the surface. A damaged or excessively worn disc will affect the proper functioning of the brake pads.

Brake fluid type and bleeding

It is recommended to use high boiling point brake fluids. After installing the pads, it is important to perform a brake fluid bleed to remove any air bubbles in the circuit, as their presence may impair braking performance. It is advised to replace the brake fluid before each race, using only fluid from a new and sealed container

Pad bedding

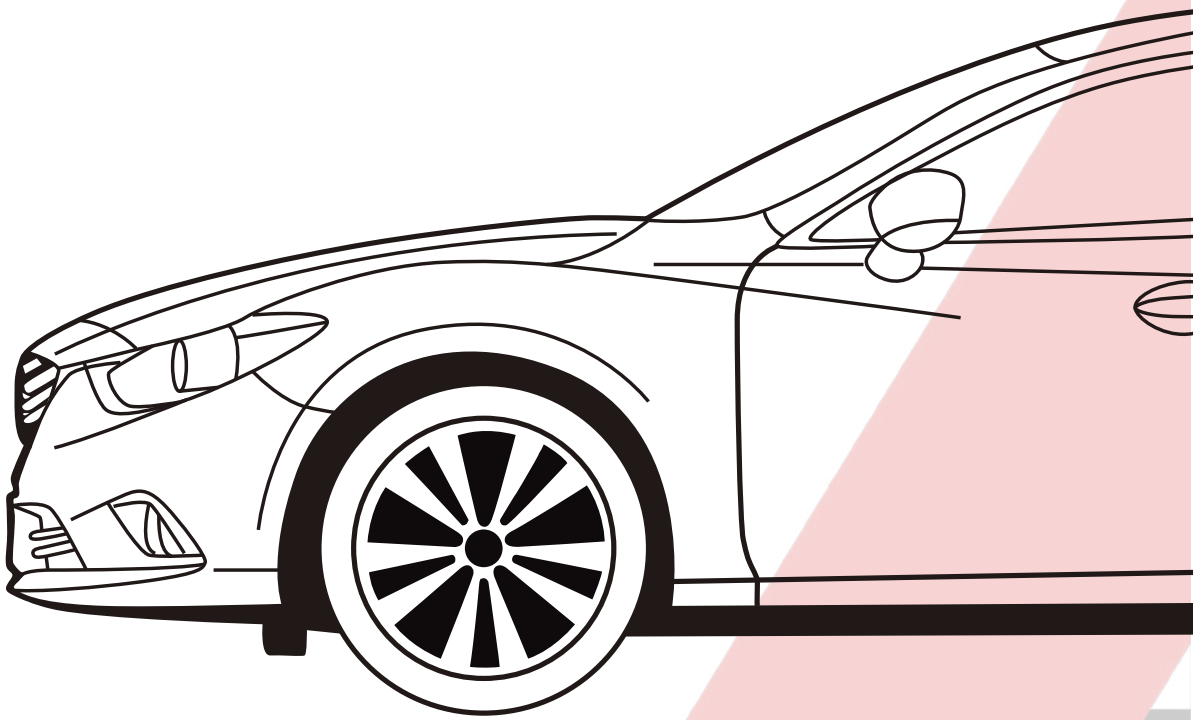

To ensure correct performance and increased lifespan, proper bedding is essential.

- **Motorsport bedding:**
  Perform about 30 moderate/low-intensity braking sessions, followed by 10-15 more intense stops, gradually increasing the temperature. Allow the system to cool down and finish with light braking to clean the discs and revive the pads. Any smoke present during bedding does not indicate malfunction, but rather that the pads have not yet reached the correct break-in state.
- **Bedding on road vehicles:**
  For new or resurfaced discs, perform moderate braking for about 150 km. If new pads are installed on used discs, it is important to note that the layer on the disc must first be removed by the new pads and then rebuilt to ensure the proper functioning of the Red Attack pads. For this reason, the break-in should be extended to approximately 400 km.

Warning

This product is intended exclusively for use in competition. It is designed to provide maximum performance in extreme conditions, such as those encountered during races, where heat resistance and braking effectiveness must be guaranteed even under the highest stresses. Using competition materials on road vehicles can indeed improve braking performance, thanks to increased grip and heat dissipation, but it may cause increased noise, vibration, and discomfort, especially during everyday use. Additionally, wear may occur more quickly compared to standard pads, as these materials are designed for optimal performance in a shorter, more intense timeframe typical of racing. Therefore, the adoption of such products on non-race vehicles requires careful evaluation based on the user's needs and driving habits.
